

SUPSI

Software Engineering and Development I

Software development project presentation checklist

No.	Context	Requirement	Check
1	Lenght of the presentation	The total number of slides is coherent with the time given for the presentation (on average: 1 slide per minute).	
2	General structure of the presentation	The structure of the presentation is as follows: - Front page - Table of contents - Context and motivation - Problem - State of the art - Approach - Results - Conclusions	
3	Front page	I/We prepared a front page, possibly based on a standard SUPSI template, with at the least: the title of the work, the title of the course for which the work was done, the academic year, and the full names of each team member.	
4	Table of contents	I/We prepared a slide that outlines the structure and the content of the presentation.	
5	Context and motivation	I/We prepared one or more slides to explain the audience the context in which my/our work was carried out, what are the general topics it deals with, and the reason(s) why it was done.	

No.	Context	Requirement	Check
6	Problem	I/We prepared one or more slides to explain my/our audience the problem my/our work solves or contributes to solve. I/we outlined the requirements and the constraints that must be satisfied. I/we possibly used one or more UML diagrams (use case, class, activity, sequence, state, etc.) to support my/our explanation.	
7	State of the art	If deemed relevant/useful, I/We prepared one or more slides summarizing the state of the art in the context of the problem at hand.	
8	Approach	Given the problem, I/We prepared one or more slides explaining the approach I/we decided to adopt to solve, or contribute to solve, it. I/we described: the design of the software product and how I/we assessed whether or not the requirements are met. I/we possibly used one or more UML diagrams (activity, sequence, state, class, etc.) to support my/our explanation.	
9	Results	I/We prepared one or more slides showing the results I/we achieved with my/our work. A demo is useful in this context, the developed software product being part of the results of the work.	
10	Conclusions	I/we prepared one or more slides putting forward the conclusion I/we draw from this work, given the original problem, the state of the art, the approach I/we used, the results I/we obtained and those I/we did not obtain (and that could therefore be part of further work).
